Analysis of Home-to-Work Commute Patterns for 1997 and 2025, by RSA

There are many ways to measure the jobs/housing balance in a region. The primary approach taken in this report is by determining the ratio between jobs and households in a Regional Statistical Area (RSA). To broaden this approach, the report looks at home-to-work commute patterns for 1997 and 2025, once again using RSAs.

The approach taken in this additional analysis was to compare the total number of productions to the total number of attractions of Home Base Work Trips in each RSA. A production indicates where the trip begins, in this case, at home. An attraction indicates where the trip ends, at work. If there are more attractions than productions, then the RSA is jobs rich and is importing workers from other RSAs. RSAs with more productions than attractions are housing rich. Workers are commuting to other areas in the morning for their employment. To achieve the results in Maps 20 and 21, the total productions were subtracted from the total attractions. Since these are round trips between home and work, a further adjustment was needed to account for just the A.M. commute to work and for any side trips, i.e. child care, shopping, meetings, etc.¹ The result of this equation equals the net import or export of workers.

Table 22		
RSAs with a Net Import of over 50,000 Workers in 1997		
RSA	Major City	Imports (In 1,000s)
23	LA CBD	184
21	South Gate	105
17	Culver City	102
44	El Toro	67
39	Newport Beach/Irvine	51
Source: SCAG Draft 2001 RTP		

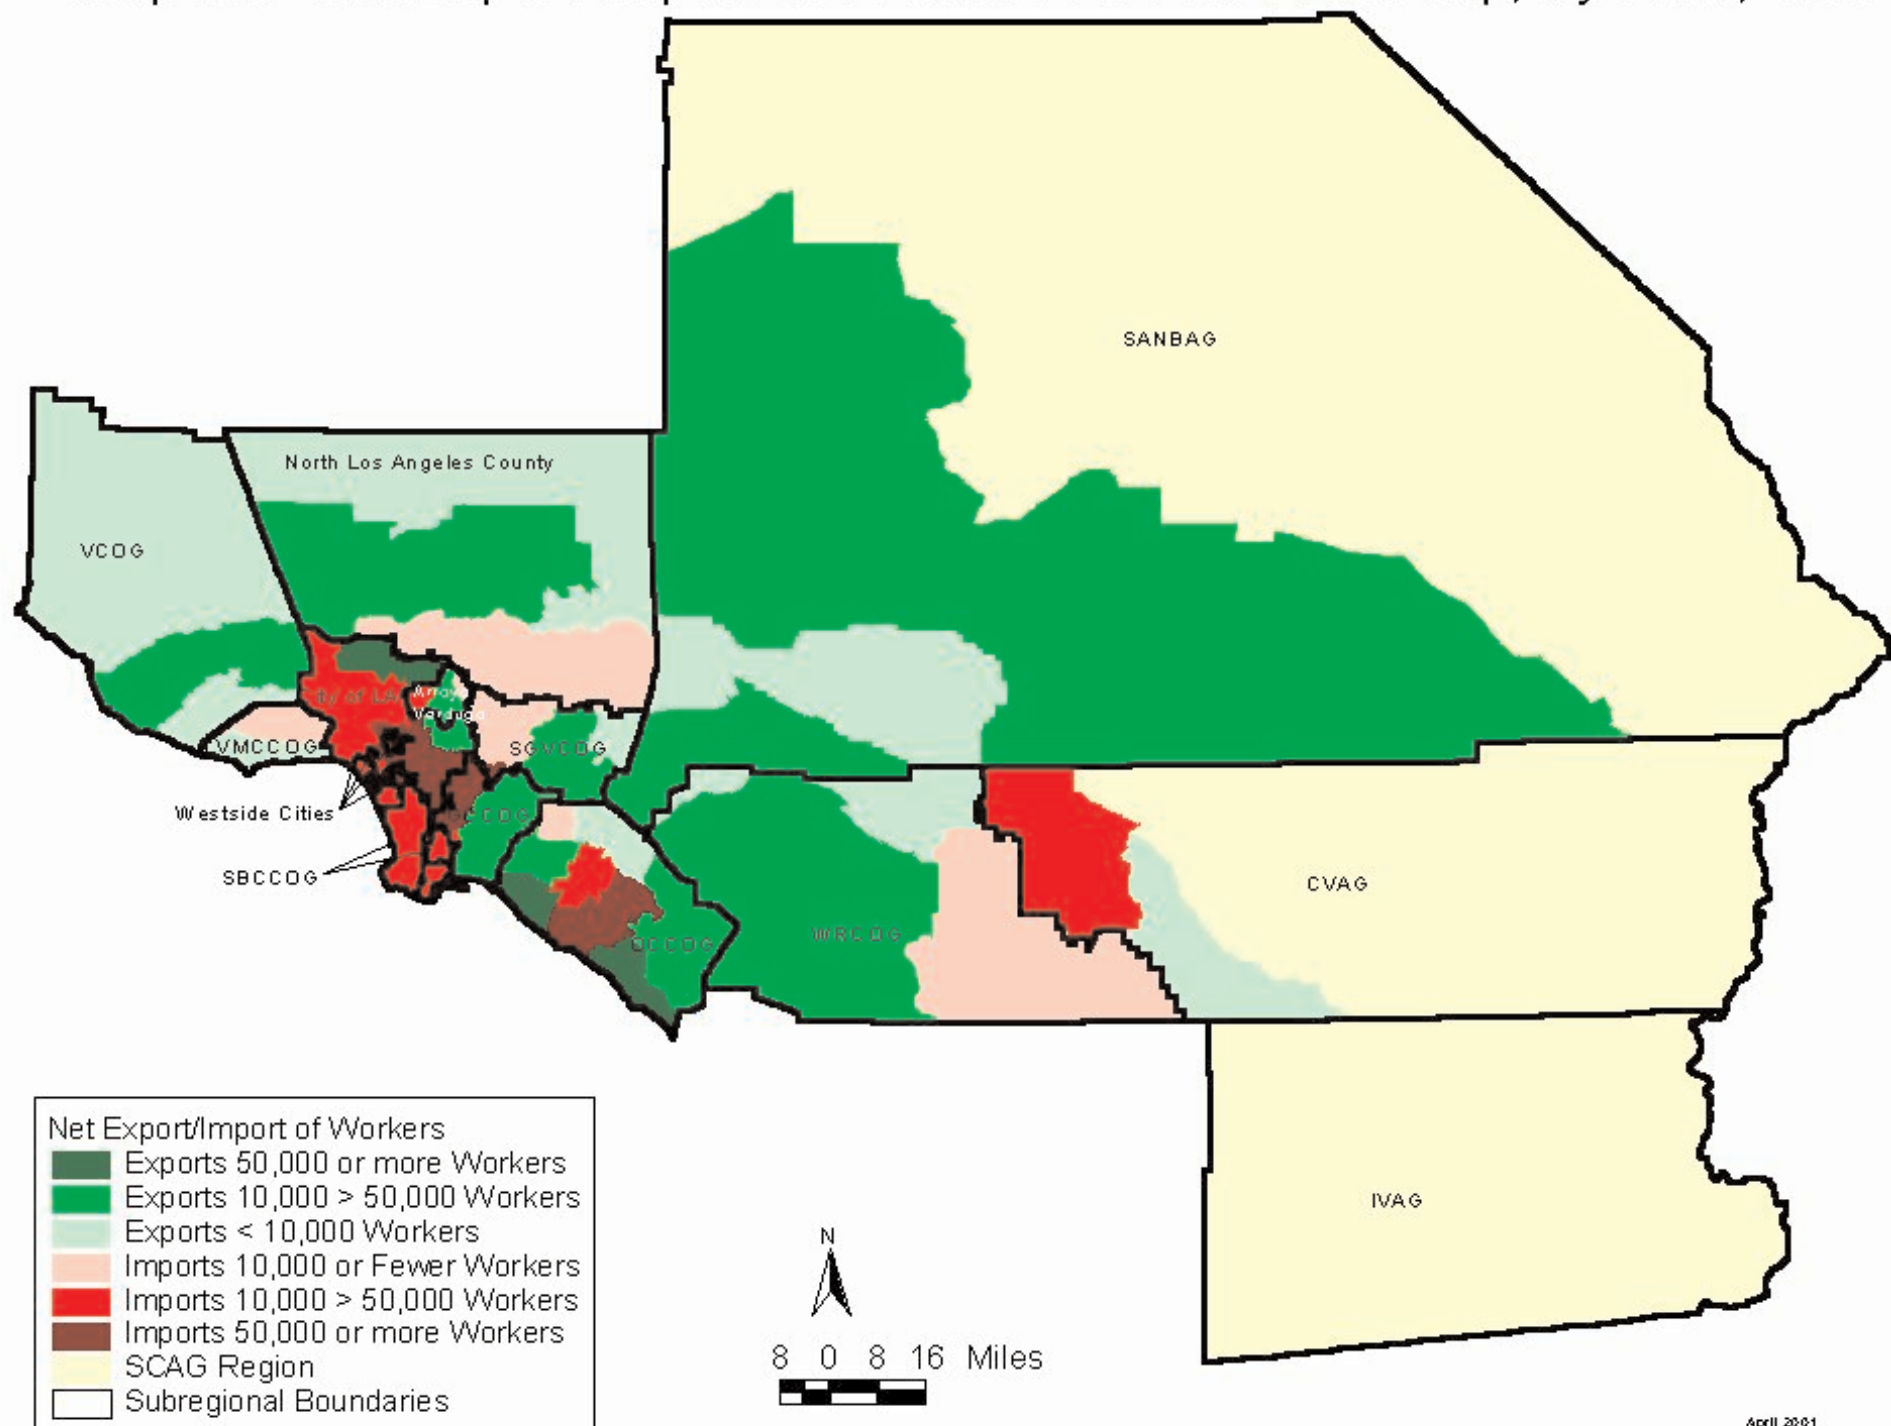

The largest importer in 1997 is, not surprisingly, the central business district of Los Angeles. While housing is increasing in this area and is projected to continue to increase, this area remains a job magnet, importing approximately 184,000 workers. As shown in Table 22, the major job centers in terms of importing workers are in central and west Los Angeles and in the Irvine area of Orange County.

The major exporters of workers surround these job centers in both Los Angeles County and Orange County. The Riverside/Corona RSA is just off this list, exporting over 46,000 workers in 1997. The major exporters for 1997 are displayed in Table 23.

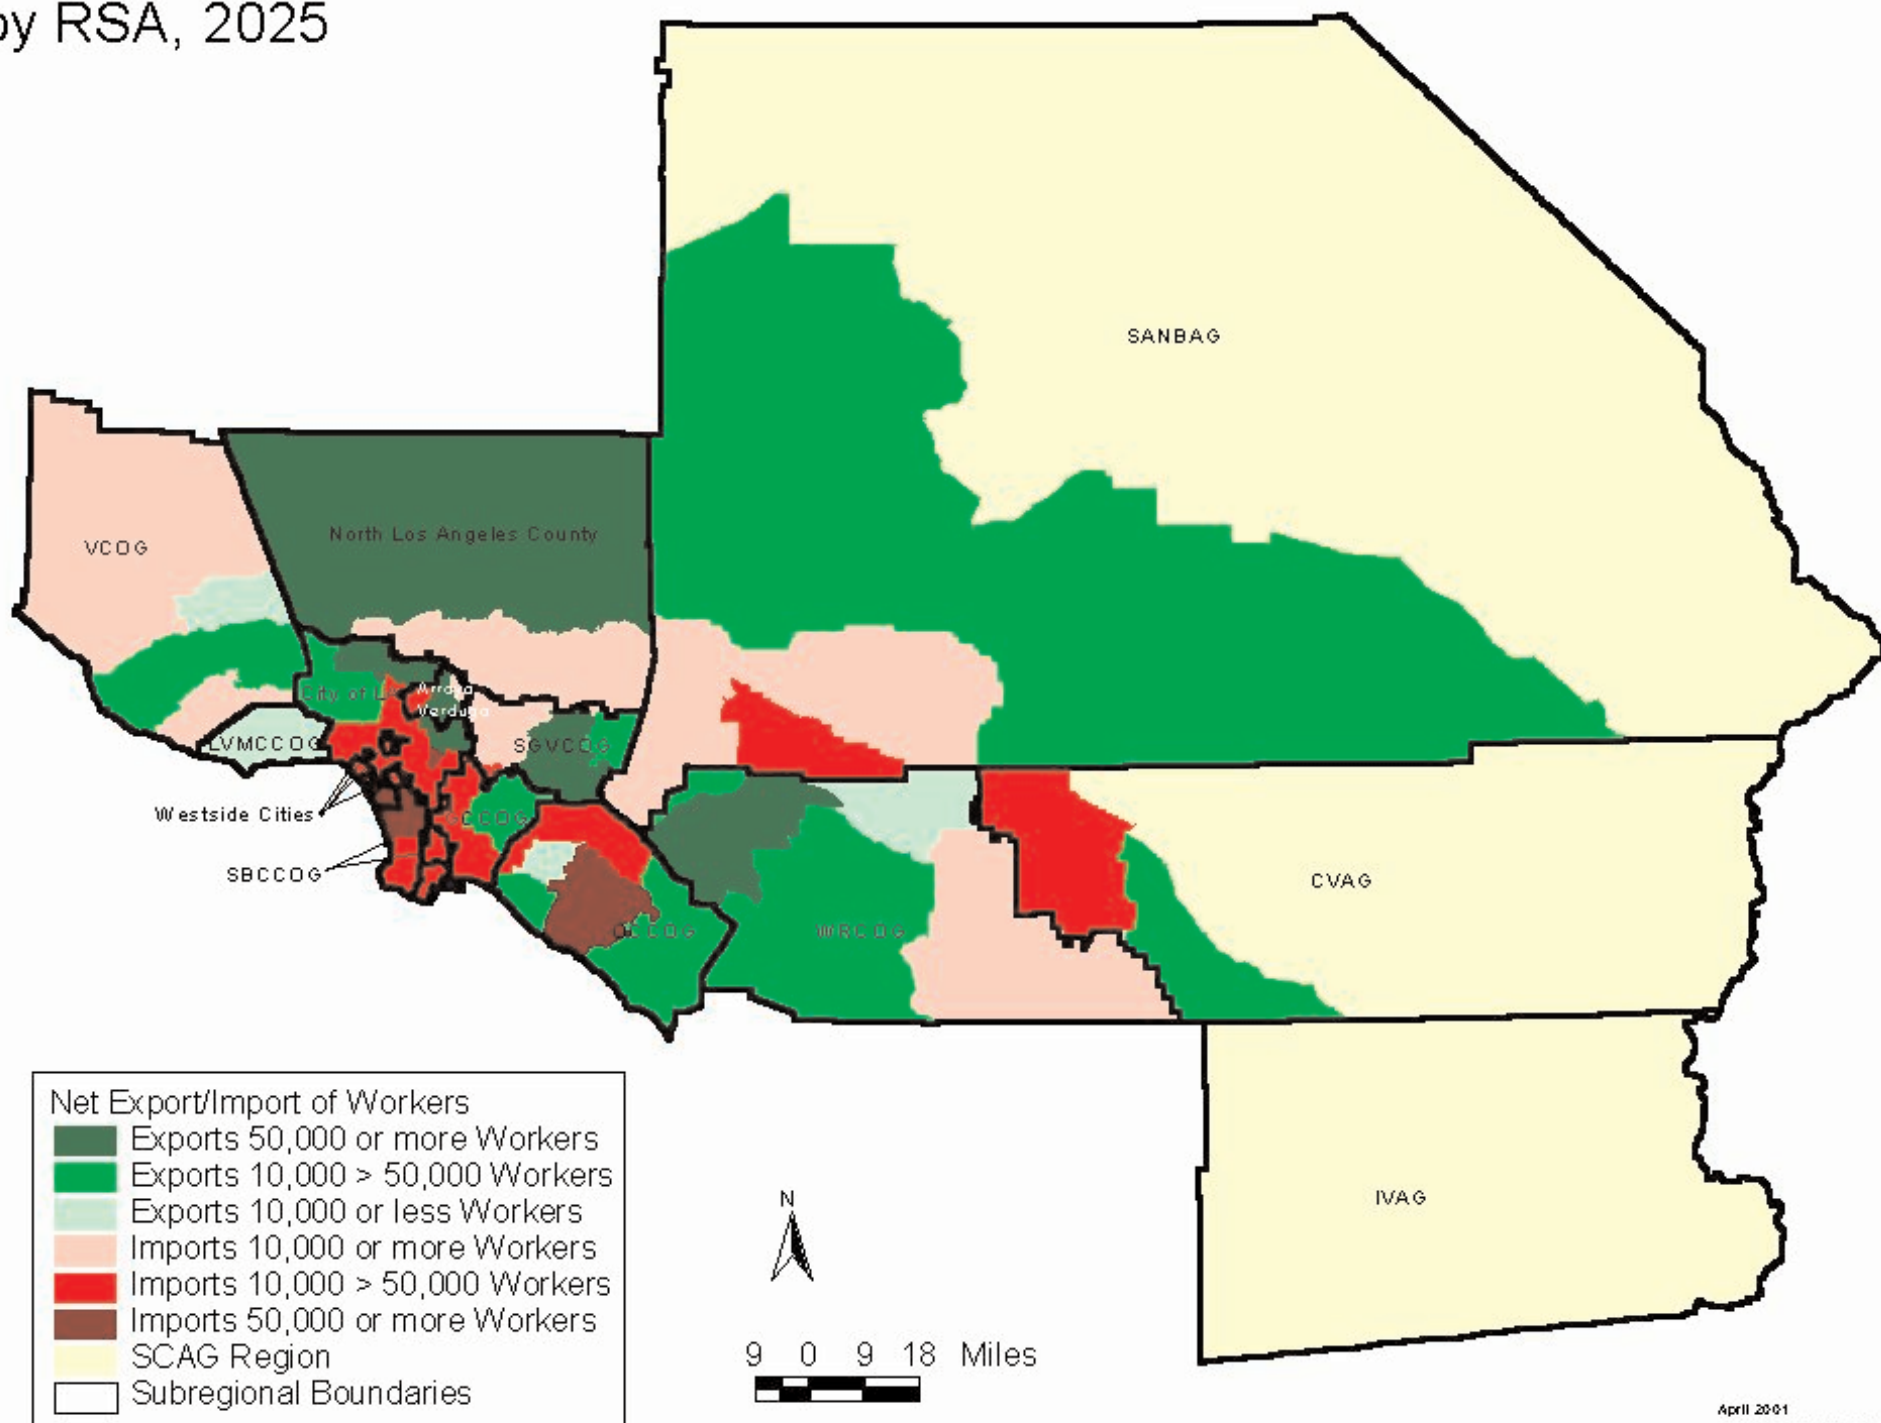

Table 23		
RSAs with a Net Export of over 50,000 Workers in 1997		
RSA	Major City	Exports (In 1,000s)
38	Huntington Beach	66
14	San Fernando	62
40	Laguna Beach/San Clemente	50
Source: SCAG Draft 2001 RTP		

¹ A.M. Home Base Work Formula: (Productions-Attractions)/(2 times 0.6) The denominator accounts for the fact that these are roundtrips (2) and that not every worker goes directly from home to work to home every day.

Map 20. Net Export/Import of Workers for AM Work Trip, by RSA, 1997

Map 21. Projected Net Export/Import of Workers for AM Work Trip, by RSA, 2025

Projections for 2025 show Orange County as the major importer of workers (Table 24). While the central business district of Los Angeles still imports the most workers, its imports have fallen since 1997. This shows the suburbanization of jobs, as the SCAG region becomes more of a multi-nodal economy with several job centers. It also shows that increased infill housing will have an effect on the number of people living and working in the downtown area. The El Toro and Santa Ana RSAs, along with the Newport Beach/Irvine RSA, replace the South Gate and Culver City RSAs as the major importers of workers in 2025.

Table 24		
RSAs Projected to have a Net Import of over 50,000 Workers in 2025		
RSA	Major City	Imports (In 1,000s)
23	LA CBD	155
44	El Toro	112
39	Newport Beach/Irvine	103
42	Santa Ana	88
18	Inglewood	56
Source: SCAG Draft 2001 RTP		

There is a very significant change in the projected regions exporting workers in 2025. Northern Los Angeles County currently exports approximately 50,000 workers to southern Los Angeles County. This number is projected to balloon to approximately 230,000 by 2025. The three RSAs in northern Los Angeles County all are projected to export more than 50,000 workers in 2025, as shown in Table 25. The Orange County RSAs that exported labor in 1997 no longer appear on the list. In the Inland Empire, the Riverside/Corona RSA remains a major exporter with exports increasing from 47,000 in 1997 to 51,000 in 2025.

Table 25		
RSAs Projected to have a Net Export of over 50,000 Workers in 2025

8	Newhall	63
26	Covina	62
9	Lancaster	59
46	Riverside/Corona	51
Source: SCAG Draft 2001 RTP		

This analysis of work trips compares well with the jobs/household ratio analysis. The two approaches both display the coastal and central part of Los Angeles County as jobs-rich and the Irvine area as jobs rich. Both maps also depict northern Los Angeles County and the majority of the Inland Empire as housing rich. However, some of the RSAs that are listed as very jobs-rich, jobs-rich, and balanced have a net export of workers. For example, the Downey region, RSA 22, appears as jobs rich yet exports a significant number of workers. This could signify that this RSA has a high workers-to-household ratio. If there are many families with two income earners, then one or both could be employed outside the RSA. Another explanation is that many of the jobs in a region go unfilled. Workers may find higher paying jobs elsewhere, so that even

though there are many jobs compared to households, those jobs remain vacant while the workers go to other areas for employment. In another example, while the Riverside/Corona RSA appears jobs-rich in 2025, this RSA is exporting 51,000 workers to other areas. This could suggest a mismatch of jobs and workers. Many living in this RSA may pass the opportunity to work in the RSA for better jobs in Orange County. These less desirable jobs may go unfilled.

There are important and significant similarities between the two approaches to measuring jobs/household balance. Both methods show that central and west Los Angeles and Irvine are the job centers for the region in 1997. Both show that housing rich areas are in the periphery in the Inland Empire, northern Los Angeles County, and southern Orange County. Both methods show the rise of Orange County as a more prominent job center and the continued strength of southern Los Angeles County. Both methods also depict the move eastward of jobs into the Inland Empire, centering on the Ontario RSA. Finally, both methods display housing rich regions, in particular northern Los Angeles County and much of the Inland Empire. These regions will continue to be housing rich and will export their workers to job centers. These regions should be the focal point for job creation strategies in an effort to steady the imbalance between jobs and housing. The job centers in Orange County and southern Los Angeles County are the key areas to promote housing development.

Current (1997) and Forecast (2025) Jobs/Housing Ratios

Methodology

Data for the number of jobs and the number of households for 2025 were collected for each census tract and then compiled for each of the RSAs. The data source is SCAG's April 26, 2000 Draft 2001 RTP for the 1997 figures and the November 9, 2000 Draft 2001 RTP for the 2025 figures. The projected numbers for 2025 include the local input of every city and county in the SCAG region. SCAG's Regional Council adopted these numbers for modeling purposes and for analysis purposes. The jobs/housing ratios reported for 1997 were separated into quintiles with eleven RSA ratios in each quintile. The 1997 quintile ranges then were applied to the 2025 projections to produce a map for 2025. The ratios were reported as very housing rich, housing rich, balanced, jobs-rich, and very jobs-rich. These divisions do not represent a countrywide or statewide average as to what ratio is a balanced jobs/housing ratio. These divisions do show where RSAs rank in relation to each other within the SCAG region. Balanced refers to the ratios that fall within the 40%-60% range of the distribution of ratios. The larger the ratio, the more jobs-rich the RSA is.

Some areas, such as the Glendale RSA, may have a low jobs/household ratio yet still be a major employment center. Other areas, such as northwestern Ventura County, have high jobs/housing ratios simply because there are few jobs and even fewer housing units. In order to determine the concentration of jobs and households in an RSA, the RSAs were ranked from the largest number of jobs (ranking of 1) down to the lowest number of jobs. There are fifty-five RSAs in the SCAG region. However, because data are not available for all of the RSAs, the lowest number is not necessarily fifty-five. This analysis ranks the absolute number of jobs for 1997 and 2025 (Figures 16-17) and the absolute number of households for 1997 and 2025 (Figures 18-19).

Limitations

Determining a balanced jobs/housing ratio presents problems. Each region of the country is different, so it is not easy to develop a standardized figure. The mean for the SCAG region in 1997 was 1.25. The projected mean for 2025 is 1.43. The 2025 mean is not in the “balanced” quintile using the 1997 standards, but is in the “Gain Jobs” quintile. This is because projections for 2025 show higher jobs/housing ratios for Orange County and the Inland Empire RSAs than the ratios in 1997. Orange County is expected to become even more jobs-rich while the Inland Empire is projected to alleviate its jobs/housing imbalance with an influx of jobs. Both of these factors are driving the average jobs/housing ratio higher.

To control for the higher ratios that are skewing the mean to a number (1.43) outside of the “balanced” range, the analysis considers the median for these two years. The projected median for 2025 is 1.31, which falls just outside of the balanced category. Still, this is up from the 1997 median of 1.12. Robust projected employment figures are sending the ratios higher as Orange County becomes more jobs-rich and as the Inland Empire begins to have its own jobs-rich RSAs.

This analysis did not examine other regions of the country to determine a statewide or nationwide balanced ratio. The analysis was concerned solely with how the different RSAs related to each other within the region.

Household Growth and Jobs/Household Growth Footprint

Methodology

Household Growth Footprint

- The number of new households is determined by subtracting the total households projected in 1997 from those projected for 2025 (new households)
- The amount of acreage needed to accommodate the number of new households between 1997-2025 is calculated by dividing the number of new households above by the average density (number of household units per acre). Three scenarios regarding average density are used: (1) the 1996 density for each county; (2) a 25% increase in density; and (3) a 50% increase in density.
- Total acreage required to accommodate housing is derived by adding acreage needed for public amenities (roads, schools etc.) to the acreage projected for housing on a 1:1 basis.
- The percentage of "developable land" needed for dividing the total acreage in c above (for each of the scenarios) derives housing (including amenities) by the "potentially developable land (excluding wetlands, prime and unique farmlands, Q3 flood zones and areas most suitable to large numbers of endangered species). In addition to this definition of potentially developable land, this analysis also used the same formula to determine the percent of land needed if developable land is defined as “developable and accessible” or “all developable land.”
- *Developable land* = all land excluding the following: land that is already developed, land under public ownership (such as federal and state-owned lands, public parklands, military

bases, and some local government-owned sites), underwater lands, and lands with a slope of 15 percent or more. It does not include privately or municipally owned watershed lands.

- *Developable and accessible lands* = This category includes all potentially developable sites (see above) within 10 kilometers (6.2 miles) of a major roadway (interstate highways, four-lane freeways, and/or major federal or state highways) or within 10 kilometers of existing urban development. These parameters were used to eliminate sites judged too far from existing infrastructure to be economically feasible for development. California developers must typically pay the full costs of extending required public infrastructure (roads, and sewer and water service) to their projects. The more distant a site from existing hookups, the greater the infrastructure extension cost. Thus at some point, far-flung development simply becomes uneconomical; for this analysis that point is set at 10 kilometers.
- *Developable and accessible sites (excluding wetlands, prime and unique farmlands, Q3 flood zones and areas most suitable to large numbers of endangered species)* = lands falling within the qualifications of developable and accessible lands (see above), and also excluding wetlands, prime and unique farmlands, Q3 flood zones and areas most suitable to large numbers of endangered species.

Jobs/ Household Growth Footprint

- The number of new jobs is determined by subtracting the total jobs for 1997 from those projected for 2025.
- The number of "new jobs households" is derived by dividing the number of new jobs by the projected average number of workers per household projected for 2025 by county.
- The amount of acreage needed to accommodate the "new jobs households" is calculated as described above for the Household Footprint for the three density scenarios. Total acreage required is derived as described above.
- The percentage of developable land needed for housing to match the jobs is calculated as described above in the Household Footprint.

Limitations

There are limitations to the household footprint study and the jobs/household footprint study. The household densities assumed for the counties are very low because they take into account all developed land and average the densities, regardless the use of the land. None of the densities for the counties represent the average densities for residential land. The densities would be higher if this were the case. The study assumes that for each acre needed for housing, an acre is needed in public services such as roads, schools, parks, etc. This may be an overestimate in urban areas where services already exist.

The acreage available for housing data do not include the opportunity for infill housing "Because no federal or state agency collects comprehensive data on sites within urban areas, the comparable potential for infill development could not be established" (HCD 43, 2000). Many cities have vacant lots of land that may be used for infill housing. While this is not the solution to the housing the projected population, infill housing could be used to alleviate some of the housing shortage. This is especially true in Los Angeles and Orange Counties, where there is little vacant land left on which to develop housing.

Development Capacity of 1993/1994 General Plans and Zoning to Accommodate Housing and Employment Demand Methodology and Limitations

Methodology

Land use data were collected from a regional land use inventory conducted in 1993 using aerial photography in conjunction with general plans. Also used in this analysis are data from the 1998 Regional Transportation Plan, corresponding to transportation analysis zones (1300 total). Included in the analysis are Ventura, Los Angeles and Orange Counties, the Western Riverside Council of Government cities, and southwestern San Bernardino County. Not included are the cities in the Coachella Valley Association of Governments, Imperial County, nor outlying cities in San Bernardino County, such as Adelanto, Barstow, and Needles. None of the cities that incorporated after 1990, such as Chino Hills, are included in this data set.

The density of the residential and employment areas cited in the general plan was used for Ventura, San Bernardino, and Riverside Counties (by state law, general plans are mandated to be consistent with zoning). For Orange and Los Angeles Counties, low density was described as seven units per acre and high density as fifteen units per acre.

Agricultural land was treated as vacant land available for development unless the general plan specified it as agricultural. The agricultural land did not have to be zoned residential to be viewed as developable. Only the agricultural zoning in the general plan excluded these lands from development being included in the total of available developable land.

Assumptions about the amount of the vacant land that has been built upon since the data were collected in 1993 were not made. Census tracts that contain both city data and unincorporated data are included as city data. As the data is several years old, the tracts may very well have been incorporated into the cities since the time when the data were collected.

Limitations

This analysis only considers land that has not been used previously for another purpose. It does not consider the availability of sites within cities that could be redeveloped to higher densities. The large areas in Los Angeles and Orange Counties that report no available vacant residential land could possibly house more residents. More residents could be housed through redeveloping abandoned or underutilized sites. This process would increase densities in these counties, helping them to house their residents.

The data for this study are admittedly out of date. Cities may have already rezoned census tracts to accommodate future growth, or rezoned some areas to higher densities. New cities have incorporated since 1990 that are not represented in this analysis. The analysis results should be viewed only as a suggestion of past zoning trends by cities in the region.

TABLE 26. EMPLOYMENT CATEGORIES BY SIC CODE COMPRISING HIGH-TECH INDUSTRIAL CLUSTERS

Computer Hardware and Software

- 357 Computer and Office Equipment
 - 3571 Electronic computers
 - 3572 Computer storage devices
 - 3575 Computer terminals
 - 3577 Computer peripheral equipment
 - 3578 Calculating and accounting equipment
- 737 Computer Programming, Data Processing and Other Computer-related Services
 - 7371 Computer programming services
 - 7372 Prepackaged software
 - 7374 Data processing and preparation
 - 7375 Information retrieval services
 - 7376 Computer facilities management
 - 7377 Computer rental and leasing
 - 7378 Computer maintenance and repair
 - 7379 Computer related services

Telecommunications

- 366 Communications Equipment
 - 3661 Telephone and telegraph apparatus
 - 3663 Radio and television broadcasting and communications equipment
 - 3669 Communications equipment, not elsewhere classified
- 481 Telephone Communications
 - 4812 Radiotelephone communications
 - 4813 Telephone communications, except radiotelephone
- 482 Telegraph and Other Message Communications
 - 4822 Telegraph and other communications
- 489 Communications Services, Not Elsewhere Classified
 - 4899 Communication services, not elsewhere classified

Test and Measurement

- 381 Search, Detection, and Navigation
 - 3812 Search, Detection and Navigation
- 382 Laboratory Apparatus and Analytical, Optical, Measuring and Controlling Instruments
 - 3821 Laboratory apparatus and furniture
 - 3822 Automatic controls for regulating residential and commercial environments
- 3823 Industrial instruments for measurement, display and control of process variables
 - 3824 Totalizing fluid meters and counting devices
 - 3825 Instruments for measuring and testing of electricity and electrical signals
 - 3826 Laboratory analytical instruments

- 3827 Optical instruments and lenses
- 3829 Measuring and controlling devices, not elsewhere classified

Entertainment

- 365 Household Audio and Visual Equipment
 - 3651 Household audio and video equipment
 - 3652 Prerecorded records and tapes
- 366 Communications Equipment
 - 3663 Radio and television broadcasting and communications equipment
- 386 Photographic Equipment and Supplies
 - 3861 Photographic equipment and supplies
- 483 Radio & Television Broadcasting
 - 4832 Radio and broadcasting stations
 - 4833 TV broadcasting stations
- 484 Cable and Other Pay TV Services
 - 4841 Cable and other pay TV services
- 504 Professional and Commercial Equipment--Wholesale
 - 5043 Photographic equipment and supplies--wholesale
- 731 Advertising
 - 7313 Radio, TV, publisher representatives
- 781 Motion Picture Production & Services
 - 7812 Motion picture and video production
 - 7819 Services allied to motion pictures
- 782 Motion Picture Distribution & Services
 - 7812 Motion picture and tape distribution
 - 7829 Motion picture distribution services
- 792 Theatrical Producers (Except Motion Picture), Bands, Orchestras, and Entertainers
 - 7922 Theatrical producers & services
 - 7929 Entertainers & entertainment groups
 - 7933 Amusement parks

Biotechnology

- 283 Drugs
 - 2833 Medicinal chemicals and botanical products
 - 2834 Pharmaceutical preparations
 - 2835 In vitro and in vivo diagnostic substances
 - 2836 Biological products
 - 2839
- 384 Surgical, Medical and Dental Instruments and Supplies
 - 3841 Surgical and medical instruments and supplies
 - 3842 Orthopedic, prosthetic and surgical appliances and supplies
 - 3843 Dental equipment and supplies
 - 3844 X-ray apparatus and tubes and related irradiation apparatus
 - 3845 Electro medical and electrotherapeutic apparatus

385 Ophthalmic Goods
 385 Ophthalmic Goods
873 Research, Development, and Testing Services
8731 Commercial Physical and Biological Research (37.5% of employment figures)
 8733 Noncommercial Research Organizations (22.2% of employment figures)

Aerospace

372 Aircraft and Parts
376 Guided Missiles and Space Vehicles and Parts

Warehousing and Trucking

42 Motor Freight Transportation and Warehousing

ADDENDUM

At its April 5, 2001 meeting, the Regional Council of the Southern California Association of Governments adopted the report *The New Economy and Jobs/Housing Balance in Southern California*. On April 12, 2001, the Regional Council adopted the 2001 Regional Transportation Plan (RTP). The adoption of the RTP included the adoption of Aviation Scenario 8. This scenario limits the growth of Los Angeles International Airport (LAX) and assigns substantial growth to Ontario International Airport and the yet-to-be constructed commercial airport at El Toro in Orange County. Because of the adopted aviation policy scenario and the demographic implications of a different distribution of air traffic, the baseline data for population, employment, and households used in the analyses of this report was adjusted. Overall, the changes do not affect the conclusions of this report. This update is intended to highlight some of the significant changes.

The new data show jobs increasing near Ontario International Airport and the El Toro airport compared to previous forecasts used. Regional Statistical Area (RSA) 46, the Pomona RSA changes from balanced to jobs-rich as it will benefit from the jobs that would be induced by more air traffic in the neighboring Ontario RSA. In a similar instance, RSA 46, the Riverside/Corona RSA, changes from jobs-rich to very jobs-rich. The effect of the airport at El Toro is seen in RSA 43, Southeast Orange County, which changes from jobs-rich to very jobs-rich.

The new data's effect on LAX is seen when the data are ranked according to the top ten employment regions for 2025. RSA 18, the Inglewood/South Bay RSA, falls one spot from eighth on the list to ninth on the list and the employment projection has been lowered by 15,000 jobs. While RSA 17, the Culver City/West Los Angeles RSA, remains the RSA with the most jobs, its employment is also affected by the constraint on LAX expansion as the employment forecast has been lowered by 20,000.

Overall, jobs-rich regions remain in southern Los Angeles County, in Orange County, and along the coast in Ventura County. With the continued population and employment growth in the Inland Empire, Ontario, Riverside, and San Bernardino City will become major employment centers. Housing-rich regions remain in the periphery, in the Inland Empire, and, in particular, in North Los Angeles County. Key recommended strategies to achieve a better jobs/housing balance in the region still are promoting infill housing development in coastal communities and promoting new economy, high paying jobs in inland areas.
